## 1. Project Description

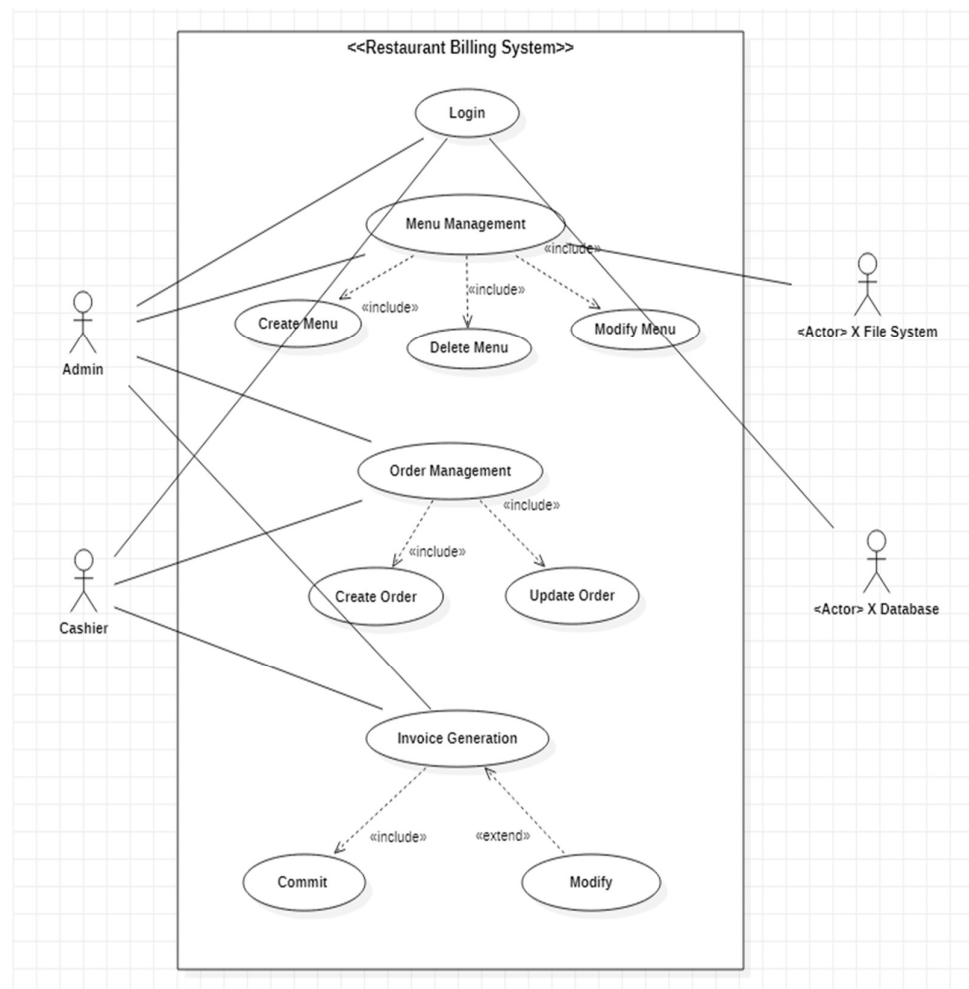

Restaurant Billing System is a computer-based billing system with user friendly interface which automatically manages the billing process of the customer very easily taking only a short period of time. This System would benefit for restaurant Staff for easy and automated generation of bills. The billing staff can update the order for a particular table and thus it eliminates the calculation errors.

## 2. Analysis and Design Models

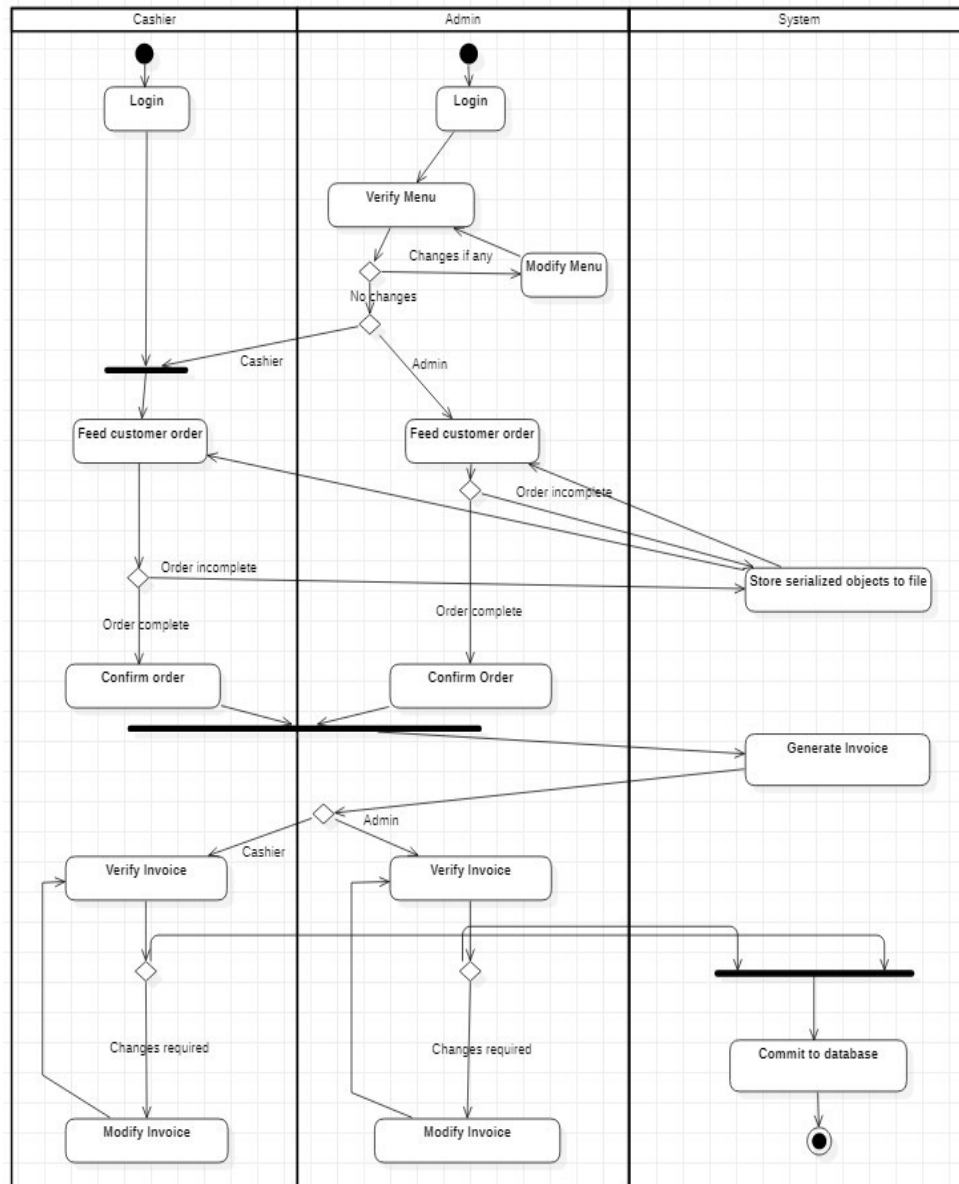

Use case

# Class Diagram

## Activity Diagram

### **3. Tools and Frameworks Used**

- a. Framework used - Java Swing
- b. IDE – NetBeans
- c. Language - Java Core
- d. Database used - MySQL

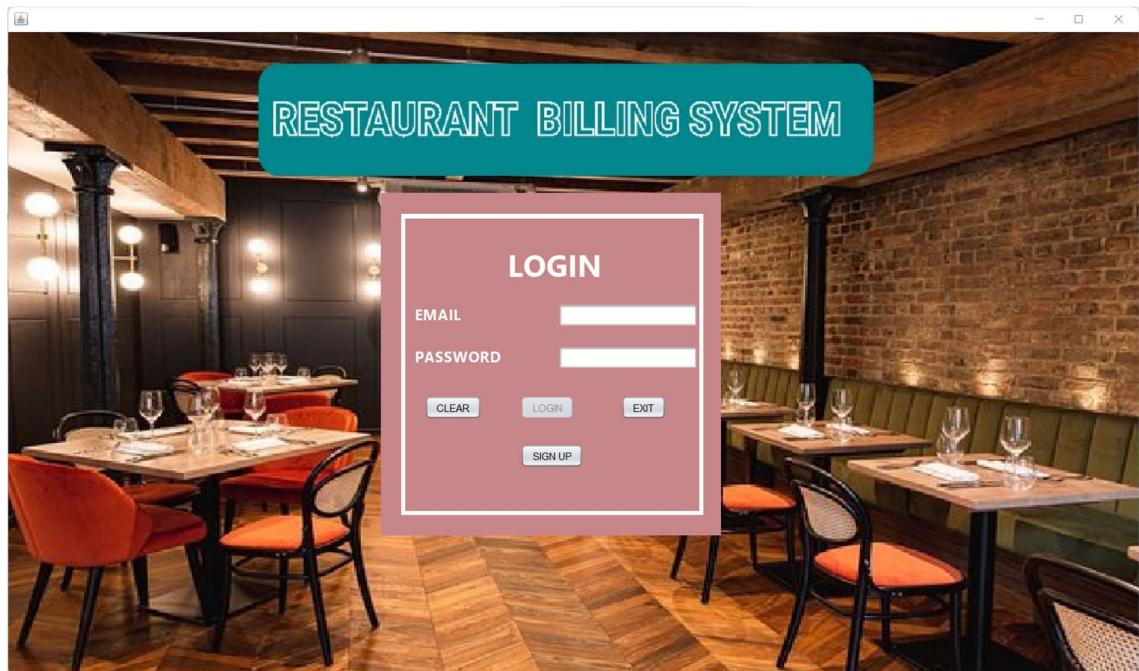

### **4. Design Principles and Design Patterns Applied**

SOLID principles are a set of design principles that reduces the coupling between classes. This project follows the Single Class, Single Responsibility principle of the SOLID principles. For example, the Menu class in menu management is responsible only for modifications to menu. Open closed principle has also been used. Here, Login extends JFrame. Login class inherits properties from java.awt.Frame class.

Menu object is singleton. Use of framework adds factory pattern to the project. The onKeyRelease events used to validate inputs follows Observer pattern.
